

BLUEFAX INFORMATION

BlueFax is a turnkey fax solution for the AS/400 that supports sending, receiving and printing of fax documents. Any AS/400 print spool file can be sent as a fax using BlueFax. Faxes can be sent individually by any AS/400 terminal user or they can be sent automatically to a predetermined location. Faxes can also be sent from attached PC's using a PC word processing system to prepare the text. With a few simple changes, your system applications can even create output directly to fax.

BlueFax is a turnkey fax product. No special hardware is needed for the AS/400. The only prerequisite is a communications port, a telephone line, and a fax modem. All you need to do to start sending faxes directly from your AS/400 is load the software and attach the modem to the system and the phone line. Typical installation time is around 20 minutes.

BlueFax can send output from existing AS/400 applications with little or no programming changes. The outbound fax capability is very fast and uses little system overhead. Support is included for adding logos and signatures to outbound faxes. Faxes can be sent to individual fax destinations or to a list of destinations in a distribution list.

In addition to sending faxes, BlueFax supports receiving, storing and printing faxes. To print faxes, an attached HP LaserJet PC printer (HP III or higher, or an equivalent printer) is required. The printer can be attached to a PC running Client Access/400 (PC/Support) or to the printer port on a dual-session terminal.

Basic BlueFax features:

- Installs in 20 minutes or less.
- Full graphic support for 3489 terminals.
- Full graphic support for overlay and scaled fonts.
- The [BlueFax client 2000](#) enables you to send faxes directly from the word processing software on an attached PC.
